

SPX Daily Tactical Analysis

One page — what you get daily, why you need it, and what it costs.

\$29 / MONTH · MONTH ONE FREE · CANCEL BEFORE FIRST BILL

WHAT YOU GET EVERY DAY

Delivered by email after the US close, with a searchable web archive of all reports and underlying state.

- The report. Session snapshot, eight analysis sections, and an 18-row decision matrix: regime, action threshold, volatility and drift inputs, exhaustion score, trend, close position, RSI/MFI, ERP state and trend, credit, breadth, VIX, leverage state, Monte Carlo edge, and one recommended action.
- Exact levels, priced. Fibonacci zones off the confirmed swing structure; the SMA/50 convergence zone; the ERP-confirmed re-entry floor (the SPX price where the equity risk premium re-expands to 0.5%); and the four liquidation zones off the active swing high — 3% caution, 5–7% nervous, 10% margin-call wave, 15% cascade.
- Quantified edge. Monte Carlo with regime-aware inputs — drift reduced as extension above the 200-day SMA climbs, volatility from today's realized vol — plus a rally-exhaustion score, first-hit and cascade probabilities, and median days to targets.
- Regime-specific action bars. Thresholds: 65% (Early/Mid Bull), 70% (Late Bull/Topping), 75% (Bear Market). A setup is only actionable if the adjusted probability clears the bar for its regime.
- The state file. Machine-readable JSON per day plus an audit trail — what the model attempted to emit versus what the engine corrected.

WHY YOU NEED IT

Discretionary process degrades on red weeks: stale levels are treated as valid resistance, pullbacks are bought without confirmation, and prior calls are quietly abandoned. This system forces, every session: the confirming evidence, the conflicting evidence, the primary tension, and one explicit action. Levels re-anchor by state machine when price accepts above the prior high.

WHY THIS IS NOT ANOTHER NEWSLETTER

Numbers are computed, not generated. Close, ERP, fibs, probabilities, and the matrix are computed deterministically in Python (yfinance + a maintained EPS history). The AI classifies structure and writes prose; it cannot move a number — an enforcement step overwrites every numeric field before publication.

- Validated, not vibes. Schema validation on both passes, a one-shot repair pass on failure, and a full run log of warnings, repairs, and enforcement actions.
- Accountable to its own calls. The system carries a rolling structural-bias arc (one year) and a 12-week EPS trend into every analysis. Regime flips must be argued against the record, not announced from nothing.

HOW IT PAYS FOR ITSELF

One avoided error covers the year. The framework is built around the four most expensive ones:

1. Buying the 23.6% pause zone as a re-entry — it is not a deployment level outside Early Bull conditions.
2. Adding through a topping structure — the trim ladder is fully active above 24x forward PE; ERP below 0.5% shifts the posture to trim bias.
3. Averaging down into a liquidation cascade — the 10% and 15% zones off the swing high are labeled before they trigger.
4. Re-entering without confirmation — three of four checklist conditions (close above prior high, RSI turn, breadth improvement, VIX reversal) are required before any pullback is actionable.

PRICING, TERMS & DELIVERY

\$29/month, billed monthly, no lock-in, no annual contract. Month one free — a full 10 trading days. Cancel before the first bill, pay nothing.

Delivery: daily email after US close (est. 6–8 pm ET); web archive with every report, state file, and audit trail.

For informational purposes only. Not investment advice or a recommendation to buy or sell any security. The report is produced by a systematic process and does not guarantee returns.
